## BACKGROUND OF THE INVENTION

This invention relates to the use of certain alpha2delta ligand for the treatment of fibromyalgia and other central nervous system disorders. Fibromyalgia (FM) is a chronic syndrome characterized mainly by widespread pain, unrefreshing sleep, disturbed mood, and fatigue. The main symptoms fibromyalgia include pain, sleep, mood disturbances and fatigue. Syndromes commonly associated with fibromyalgia include irritable bowel syndrome, and migraine headaches, among others. Success of treating fibromyalgia with a single pharmacological agent has been characterized as modest and results of clinical trials have been characterized as disappointing. It is believed that based on current understanding of the mechanisms and pathways involved in fibromyalgia, multiple agents will be required, aimed at the major symptoms of pain, disturbed sleep, mood disturbances, and fatigue. Fibromyalgia patients are often sensitive to side effects of medications, a characteristic perhaps related to the pathophysiology of this disorder (Barkhuizen A, Rational and Targeted pharmacologic treatment of fibromyalgia. Rheum Dis Clin N Am 2002; 28: 261-290; Leventhal LJ. Management of fibromyalgia. Ann Intern Med 1999;131:850-8).

While fibromyalgia is a complex disorder with multiple facets, this complexity can be well assessed (Yunus MB, A comprehensive medical evaluation of patients with fibromyalgia syndrome, *Rheum Dis N Am* 2002; 28:201-217). The diagnosis of FM is usually based on the 1990 recommendations of the American College of Rheumatology classification criteria (Bennett RM, The rational management of fibromyalgia patients. *Rheum Dis Clin N Am* 2002; 28: 181-199; Wolfe F, Smythe HA, Yunus MB, Bennett RM, Bombardier C, Goldenberg DL, et al. The American College of Rheumatology 1990 criteria for the classification of fibromyalgia: Report of the Multicenter Criteria Committee. *Arthritis Rheum* 1990; 33:160-72). Evaluation, management, and pharmacological treatment of fibromyalgia have been reviewed (Barkhuizen A, Rational and Targeted pharmacologic treatment of fibromyalgia. *Rheum Dis Clin N Am* 2002; Buskila D, Fibromyalgia, chronic fatigue syndrome and myofascial pain syndrome. *Current opinions in Rheumatology* 2001; 13: 117-127; Leventhal LJ. Management of fibromyalgia. *Ann Intern Med* 1999;131:850-8; Bennett RM, The rational management of fibromyalgia patients. *Rheum Dis Clin N Am* 2002; 28: 181-199; Yunus MB, A comprehensive medical evaluation of patients with fibromyalgia syndrome, *Rheum Dis N Am* 2002; 28:201-217 ).

Restless Legs Syndrome (RLS) has been characterized by the minimal diagnostic criteria: (a) desire to move the extremities, often associated with paresthesias/dysesthesias; (b) motor restlessness; (c) worsening of symptoms at rest with at least temporary relief by activity, and (d) worsening of symptoms in the evening or night. Other features commonly seen in RLS include sleep disturbance, periodic limb movements in sleep and similar involuntary movements while awake, a normal neurological examination in the idiopathic form, a tendency for the symptoms to be worse in middle to older age, and, in some cases, a family history suggestive of an autosomal dominant mode of inheritance. See Walters AS; Toward a better definition of the restless legs syndrome; The International Restless Legs Syndrome Study Group; *Mov Disord.* (1995) 10(5): 634-42. See also, Bhatia M and Bhowmik D; Restless legs syndrome in maintenance haemodialysis patients; *Nephrol Dial Transplant* (2003) 18: 217. Restless legs syndrome can be a primary disorder, or a secondary disorder associated with, for example, renal insufficiency, heredity, pregnancy,

poliomyelitis, infectious diseases, avitaminosis, different types of anemia, diabetes, and certain drugs (e.g. prochloroperazine, lithium, and mianserin).

25 The term "lower alkyl" is a straight or branched alkyl group of from 1 to 4 carbons.

The term "alkyl" is a straight or branched hydrocarbon radical of from 1 to 6 carbon atoms including but not limited to methyl, ethyl, propyl, n-propyl, isopropyl, butyl, 2-butyl, tert-butyl, pentyl, except as where otherwise stated.

30 The phenyl groups of compounds of the formula 1 may be unsubstituted or substituted by from 1 to 3 substituents selected from hydroxy, carboxy, carboalkoxy, halogen, CF<sub>3</sub>, nitro, alkyl, and alkoxy. Preferred substituents are halogens.

Since amino acids are amphoteric, pharmacologically compatible salts when R is hydrogen can be salts of appropriate inorganic or organic acids, for example, hydrochloric, sulphuric, phosphoric, acetic, oxalic, lactic, citric, malic, salicylic, malonic, maleic, succinic, methanesulfonic acid, and ascorbic. Starting  
5 from corresponding hydroxides or carbonates, salts with alkali metals or alkaline earth metals, for example, sodium, potassium, magnesium, or calcium are formed. Salts with quaternary ammonium ions can also be prepared with, for example, the tetramethyl-ammonium ion. The carboxyl group of the amino acids can be esterified by known means.

10 Certain of the compounds employed in the methods of the present invention can exist in unsolvated forms as well as solvated forms, including hydrated forms. In general, the solvated forms, including hydrated forms, are equivalent to unsolvated forms and are intended to be encompassed within the scope of the present invention.

15 Certain of the compounds employed in the methods of the present invention possess one or more chiral centers and each center may exist in the R(D) or S(L) configuration. The present invention includes all enantiomeric and epimeric forms as well as the appropriate mixtures thereof.

20 One benefit of using the compounds of this invention to treat fibromyalgia is that they are not addictive. In these methods, the compounds can be combined with other agents including antidepressant and/or anti-anxiety agents.

A compound of structure 30 could be prepared from a compound of structure 29 by treatment with an aqueous acid such as hydrochloric acid and alike at a temperature between room temperature and reflux. As an alternative, a compound of structure 30 can be prepared from a compound of structure 32 by treatment with trifluoroacetic acid in a solvent such as CH<sub>2</sub>Cl<sub>2</sub> or EtOAc and alike. Compound 32 could be prepared by base mediate hydrolysis of a Boc

protected lactam such as compound 31 which itself could be prepared from a compound of structure 29 by treatment with di-tert-butyl dicarbonate in a solvent such as THF and alike. The treatment of the Boc-lactam 31 with aqueous sodium hydroxide for example would give rise to the acid 32.

5           A compound of structure 29 could be prepared from compound of structure 28 ( $n = 0$ ) by treatment with sodium or lithium metal in ammonia. Preferably, the reaction is carried out with sodium metal in ammonia. Alternatively, a compound of structure 29 could be prepared from compound of structure 28 ( $n = 1$  or  $2$ ) by treatment with ceric ammonium nitrate in a mixture of  
10           acetonitrile and water. Other methods known in the literature for the removal of substituted alkoxy benzyl groups from nitrogen are described in Green, *Protective Groups in Organic Synthesis*, Wiley, 2 ed, 1991 and could be utilized.

          A compound of structure 28 could be prepared from a compound of structure 27 (where LG is a suitable leaving group such as a halide or an alkyl  
15           sulphonate, preferably an iodide would be used) by carbon-carbon bond forming reactions known in the art. Several methods exist in the literature for the coupling of organohalides or organoalkyl sulphonates with organometallic reagents in the presence of various metal salts as summarized in *Comprehensive Organic Synthesis*, volume 3:413 which could be utilized. For example, a compound of  
20           structure 28 could be prepared from a compound of structure 27 (where LG is iodide) by treatment with a suitable secondary halide (chloride or iodide) in the presence of magnesium metal, iodine and copper bromide dimethylsulphide in a solvent such as tetrahydrofuran and alike. Alternatively the method according to El Marini, *Synthesis*, 1992:1104 could be used. Hence, a compound of  
25           structure 28 could be prepared from a compound of structure 27 (where LG is iodide) by treatment with suitable methyl-substituted secondary halide such as an iodide in the presence of magnesium, iodine and lithium tetrachlorocuprate in a solvent such as tetrahydrofuran and alike.

          A compound of structure 27 incorporates a suitable leaving group, which  
30           would undergo nucleophilic substitution with suitable nucleophile. Examples of such leaving groups include halides such as chloride, bromide, or iodide, and sulphonic esters such as mesylate, tosylate, triflate, nosylate, and alike.

A compound of structure 27 (where LG = iodide) could be prepared from a compound of structure 26 through treatment with iodine, triphenylphosphine, and imidazole in a solvent such as toluene and alike.

5 A compound of structure 26 could be prepared from compound of structure 25 by treatment with a metal borohydride, such as sodium borohydride in a solvent such as tetrahydrofuran or DME and alike.

10 Compound 25 could be prepared in a similar fashion to the procedures of Zoretic et al, *J. Org. Chem.*, 1980;45:810-814 or Nielsen et al *J. Med. Chem.*, 1990;33:71-77 using an appropriate benzylamine, such as but not limited to benzylamine, 4-methoxybenzylamine or 2,4-dimethoxybenzylamine.

15 As an alternative approach, a compound of structure 26 could be treated with sodium metal and ammonia to give 4-hydroxymethyl-pyrrolidinone which could be iodinated affording 4-iodomethyl-pyrrolidinone. 4-iodomethyl-pyrrolidinone could then be coupled with organometallic reagents according to the above procedures avoiding protection of the lactam nitrogen as below.

20 Analogous to the above methods a lactam of structure 33 (see Nielsen et. al., *J. Med. Chem.*, 1990;33:71-77 for general method of preparation) could be employed thus establishing fixed stereochemistry at C3 of the final amino acids.

Method 4

A compound of structure 40 could be prepared from compound of structure 39 through treatment with diethylaminosulphur trifluoride in a solvent such as methylene chloride at a temperature between -78°C and room temperature. Other methods for the fluorination of alcohols are known and could be utilized as exemplified in Wilkinson, *Chem. Rev.* 1992;92:505-519. Compounds of structure 40 can be converted to the requisite  $\gamma$ -amino acid as described in method 3 above.

A compound of structure 39 could be prepared from compound of structure 38 through treatment with osmium tetroxide and sodium periodate in a

solvent such as THF and water and reduction of the resultant intermediate with sodium borohydride in a solvent such as ethanol.

Compounds of structures **38** and **34** could be prepared from compound of structure **33** according to the principles described in method 3.

5           An alternative procedure for the synthesis of alcohol **39** ( $n=0$ ) involves the treatment of a compound of structure **36** with a metal borohydride, such as sodium borohydride in a solvent such as tetrahydrofuran or DME and alike to give a compound of structure **37**, the fluorination of which could be achieved in a similar manner to the preparation of a compound of structure **40**. A compound of  
10       structure **36** could be prepared from compound of structure **35** through treatment with sodium or lithium chloride in aqueous DMSO at a temperature between room temperature and reflux. Preferably the reaction is carried out using sodium chloride in aqueous DMSO at reflux. A compound of structure **35** could be prepared from compound of structure **34** through treatment with a suitable methyl  
15       malonic acid diester, such as dimethyl methylmalonate and alike with sodium hydride in a solvent such as DMSO or THF and alike. Preferably the reaction is carried out by adding NaH to a solution of dimethyl methylmalonate in DMSO followed by the addition of the lactam **34** (where LG is preferably iodide or as defined in method 3) pre-dissolved in DMSO.

20           Compounds **39** and **37** can be converted to the free amino acids bearing a hydroxyl group by the methods described above.

The following compounds could be prepared in this manner:

(3S)-3-Aminomethyl-6-fluoro-5-methyl-hexanoic acid;

(3S)-3-Aminomethyl-6-fluoro-5-methyl-hexanoic acid;

25       (3S)-3-Aminomethyl-7-fluoro-5-methyl-heptanoic acid;

(3S)-3-Aminomethyl-8-fluoro-5-methyl-octanoic acid;

(3S)-3-Aminomethyl-9-fluoro-5-methyl-nonanoic acid;

(3S)-3-Aminomethyl-7-hydroxy-5-methyl-heptanoic acid; and

(3S)-3-Aminomethyl-6-hydroxy-5-methyl-hexanoic acid.

Method 5

A compound of structure **41** could be prepared from compound of structure **39** through treatment with a suitable alkyl iodide (or alkyl sulphonate), such as methyl iodide and alike, and a base such as n-butyl lithium or sodium hydride and alike, in a solvent such as DMSO or THF and alike. Preferably the reaction is carried out by adding NaH to a solution of the alcohol in DMSO followed by the addition of the alkyl iodide and heating of the reaction mixture at a temperature between room temperature and reflux. The conversion of compounds of structure **41** to the  $\gamma$ -amino acids has been described above.

Alternatively, compounds of structure **41** could be derived from compounds of structure **42** (where LG = iodide, bromide or an sulphonic acid ester, as exemplified in method 3) by treatment of an appropriate alkoxy anion in a solvent such as DMSO or THF and alike. A compound of structure **42** would also serve as a substrate for carbon-carbon bond forming procedures as outlined in method 3.

Compounds which could be prepared in this manner include:

- (3S)-3-Aminomethyl-7-hydroxy-5-methyl-heptanoic acid;  
(3S)-3-Aminomethyl-7-methoxy-5-methyl-heptanoic acid;  
(3S)-3-Aminomethyl-7-ethoxy-5-methyl-heptanoic acid;  
(3S)-3-Aminomethyl-5-methyl-7-propoxy-heptanoic acid;  
5 (3S)-3-Aminomethyl-7-fluoromethoxy-5-methyl-heptanoic acid;  
(3S)-3-Aminomethyl-7-(2-fluoro-ethoxy)-5-methyl-heptanoic acid;  
(3S)-3-Aminomethyl-5-methyl-7-(3,3,3-trifluoro-propoxy)-heptanoic acid;  
(3S)-3-Aminomethyl-6-hydroxy-5-methyl-hexanoic acid;  
(3S)-3-Aminomethyl-6-methoxy-5-methyl-hexanoic acid;  
10 (3S)-3-Aminomethyl-6-ethoxy-5-methyl-hexanoic acid;  
(3S)-3-Aminomethyl-5-methyl-6-propoxy-hexanoic acid;  
(3S)-3-Aminomethyl-6-fluoromethoxy-5-methyl-hexanoic acid;  
(3S)-3-Aminomethyl-6-(2-fluoro-ethoxy)-5-methyl-hexanoic acid; and  
(3S)-3-Aminomethyl-5-methyl-6-(3,3,3-trifluoro-propoxy)-hexanoic acid.

Method 6

Compounds of structure **53** could be prepared from a compound of structure **45** as shown above and by the general procedures described in Hoekstra et. al., *Organic Process Research and Development*, 1997;1:26-38.

Compounds of structure **45** can be prepared from compounds of structure **44** by treatment with a solution of chromium trioxide in water/sulfuric acid. Alternative methods of cleaving the olefin in **44** could be utilized as detailed in Hudlicky, *Oxidations in Organic Chemistry*, ACS Monograph 186, ACS 1990:77.

Compounds of structure **44** (where R<sub>2</sub> = alkyl, branched alkyl, cycloalkyl, alkyl-cycloalkyl) could be prepared from (S)-citronellyl bromide by carbon-carbon bond forming reactions known in the art and as described in method 3. The substitution of the halide in (S)-citronellyl bromide with alkoxy anions could also  
5 be used to provide compounds of structure **44** where R = alkoxy or phenoxy ethers (and appropriate substitutions thereof as according to Formula 1). Alternatively (S)-citronellol could be utilized to afford compounds of structure **44** by treatment of (S)-citronellol with a base such as sodium hydride, and treatment of the resultant alkoxide with an appropriate alkyl halide to afford ethers. In another  
10 method (S)-citronellyl bromide (or an appropriate sulphonic ester such as, but not limited to, methanesulfonic acid (S)-3,7-dimethyl-oct-6-enyl ester) could be reduced with an appropriate metal borohydride or with an aluminum hydride species, such as LAH, to provide (R)-2,6-dimethyl-oct-2-ene.

To one skilled in the art it will be appreciated that rational choice of either  
15 *R*- or *S*-citronellol or *R*- or *S*-citronellyl bromide would give rise to the requisite isomer at C5 of the final amino acid.

# Method 7

A compound of structure **58** can be prepared from a compound of structure **57** by treatment with borontrifluoride diethyletherate and triethylsilane in a solvent such as  $CH_2Cl_2$ . Alternatively the method described in Meyers, *J. Org. Chem.*, 1993;58:36-42, could be utilized thus treating a compound of structure **57** with sodium cyanoborohydride in a solvent such as THF/methanol with 3% HCl in methanol.

A compound of structure **57** can be prepared from a compound of structure **56** by treatment with dimethylamine in a solvent such as DMF and alike according to the procedure of Koot, *Tetrahedron Lett.*, 1992;33:7969-7972.

5 A compound of structure **56** can be prepared from a compound of structure **54** by treatment of a suitable primary halide **55** (iodide, bromide, or chloride) under standard transmetallation conditions with tBuLi and treatment of the resultant organometallic reagent with suitable copper salt, such as but not limited to, copper bromide or copper iodide. The resultant organo-cuprate is added to lactam (see Koot et al, *J. Org. Chem.*, 1992;57:1059-1061 for the preparation of  
10 the chiral lactam **54**) in a solvent such as THF and alike. The procedure of Koot, *Tetrahedron Lett.*, 1992;33:7969-7972 exemplifies this method.

To one skilled in the art it will be appreciated that rational choice of either *R*- or *S*-primary halides **55** would give rise to the requisite isomer at C5 of the final amino acid.

**Large scale procedure for the synthesis of acetic acid (S)-2-benzyl-3-methyl-butyl ester 173 from 171**

5           A of n-butyl lithium (10 M in hexane, 100 mL, 1000 mmol, 3.9 equiv.) was added to a solution of diisopropylamine (108.9 g, 150.9 mL, 1.076 mol, 4.20 equiv.) in THF (600 mL), at -78°C. The resulting solution was stirred for 10 minutes and warmed to 0°C, and hold at the temperature for 10 minutes. Borane-ammonia complex (31.65 g, 1.025 mmol, and 4.0 equiv) was added in one  
10       portion, and the suspension was stirred at 0°C for 15 minutes, and at 23°C for 15 minutes, and then cooled to 0°C. A solution of amide 171 (86 g, 256.41 mmol, 1 equiv.) in THF was added to the cold hydride via a cannula over 3 minutes. The reaction was stirred at 23°C for overnight, then cooled to 0°C. Excess hydride was  
15       quenched by the slow addition of 3N HCl (700 mL). The reaction mixture was diluted with more aqueous HCl (3N, 200 mL), and brine and then extracted with ether (4 × 15 mL). The ether solution was concentrated to a small volume, and 200 mL 2N NaOH was added, and stirred at 23°C for 2.5 hours. More ether was added and the layers were separated. The aqueous layer was saturated with salt and extracted with ether (3 × 200 mL). The combined organic was washed with  
20       brine and dried on sodium sulfate. The residue was flash chromatographed (Pet. ether-25% ether -TEA ) to give alcohol 172, 50 g. NMR (CDCl<sub>3</sub>) δ 7.35-7.16 (m, 5H, C<sub>6</sub>H<sub>5</sub>), 3.55 (app. t, 2H, -CH<sub>2</sub>OH), 2.71 (dd, 1H, ArCH<sub>2</sub>CH-), 2.52 (dd, 1H, ArCH<sub>2</sub>CH), 1.87 (m, 1H, CHCH(Me), 1.67 (m, 1H, CH(Me)<sub>2</sub>), 0.98 (d, 3H, CH<sub>3</sub>) and 0.96 (d, 3H, CH<sub>3</sub>).

### Synthesis of the lactam 191

20       The nitro ester **189** (2.09 g, 7.7 mmol) was dissolved in methanol (75 mL) and shaken over Raney Nickel (catalytic, prewashed with water and then methanol) under an atmosphere of hydrogen gas (39 psi) at 35°C. After 17 hours the mixture was filtered through Celite. The solvent was removed in vacuo to give an oil. <sup>1</sup>H NMR showed there had been partial reduction of the double bond so this was carried on without further purification. A sample of this partial reduced  
25       product (440 mg, 2.1 mmol) was dissolved in methanol (40 mL) and shaken over 5% Pd-C under an atmosphere of hydrogen gas. After 18 hours the catalyst was removed by filtration through Celite to obtain 442 mg (99% from partial reduced material) as a clear oil which did not need purification. Note that this and all subsequent compounds are equimolar mixtures of 2 diastereoisomers. <sup>1</sup>H NMR

### Synthesis of Example 21

The lactam **191** (428 mg, 2.0 mmol) was heated to reflux in 6N HCl  
(20 mL). After 5 hours the mixture was cooled to room temperature and washed  
with dichloromethane (2 × 10 mL). The aqueous phase was collected and the  
solvent removed in vacuo. The residue was dissolved in water (10 mL) and freeze-  
dried to give 382 mg (71%) of Example 34 as a white solid. Note that this

To one skilled in the art, the use of (R)-(+)-citronellal would afford  
compounds of opposite C5-stereochemistry to Example 21.

The compounds of the present invention can be prepared and administered  
in a wide variety of oral and parenteral dosage forms. Thus, the compounds of the  
present invention can be administered by injection, that is, intravenously,  
intramuscularly, intracutaneously, subcutaneously, intraduodenally, or  
intraperitoneally. Also, the compounds of the present invention can be  
administered by inhalation, for example, intranasally. Additionally, the  
compounds of the present invention can be administered transdermally. It will be  
obvious to those skilled in the art that the following dosage forms may comprise  
as the active component, either a compound of formula **1** or a corresponding  
pharmaceutically acceptable salt of a compound of formula **1**.

For preparing pharmaceutical compositions from the compounds of the  
present invention, pharmaceutically acceptable carriers can be either solid or

liquid. Solid form preparations include powders, tablets, pills, capsules, cachets, suppositories, and dispersible granules. A solid carrier can be one or more substances which may also act as diluents, flavoring agents, binders, preservatives, tablet disintegrating agents, or an encapsulating material.

5           In powders, the carrier is a finely divided solid which is in a mixture with the finely divided active component.

          In tablets, the active component is mixed with the carrier having the necessary binding properties in suitable proportions and compacted in the shape and size desired.

10           The powders and tablets preferably contain from five or ten to about seventy percent of the active compound. Suitable carriers are magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose, a low melting wax, cocoa butter, and the like. The term "preparation" is intended to include the  
15           formulation of the active compound with encapsulating material as a carrier providing a capsule in which the active component, with or without other carriers, is surrounded by a carrier, which is thus in association with it. Similarly, cachets and lozenges are included. Tablets, powders, capsules, pills, cachets, and lozenges can be used as solid dosage forms suitable for oral administration.

20           For preparing suppositories, a low melting wax, such as a mixture of fatty acid glycerides or cocoa butter, is first melted, and the active component is dispersed homogeneously therein, as by stirring. The molten homogenous mixture is then poured into convenient sized molds, allowed to cool, and thereby to solidify.

25           Liquid form preparations include solutions, suspensions, and emulsions, for example, water or water propylene glycol solutions. For parenteral injection liquid preparations can be formulated in solution in aqueous polyethylene glycol solution.

          Aqueous solutions suitable for oral use can be prepared by dissolving the  
30           active component in water and adding suitable colorants, flavors, stabilizing and thickening agents as desired.

          Aqueous suspensions suitable for oral use can be made by dispersing the finely divided active component in water with viscous material, such as natural or

synthetic gums, resins, methylcellulose, sodium carboxymethylcellulose, and other well-known suspending agents.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for oral administration.

5 Such liquid forms include solutions, suspensions, and emulsions. These preparations may contain, in addition to the active component, colorants, flavors, stabilizers, buffers, artificial and natural sweeteners, dispersants, thickeners, solubilizing agents, and the like.

10 The pharmaceutical preparation is preferably in unit dosage form. In such form the preparation is subdivided into unit doses containing appropriate quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete quantities of preparation, such as packeted tablets, capsules, and powders in vials or ampoules. Also, the unit dosage form can be a capsule, tablet, cachet, or lozenge itself, or it can be the  
15 appropriate number of any of these in packaged form.

The quantity of active component in a unit dose preparation may be varied or adjusted from 0.1 mg to 1 g according to the particular application and the potency of the active component. In medical use the drug may be administered three times daily as, for example, capsules of 100 or 300 mg. The composition  
20 can, if desired, also contain other compatible therapeutic agents.

In therapeutic use, the compounds utilized in the pharmaceutical method of this invention are administered at the initial dosage of about 0.01 mg to about 100 mg/kg daily. A daily dose range of about 0.01 mg to about 100 mg/kg is preferred. The dosages, however, may be varied depending upon the requirements  
25 of the patient, the severity of the condition being treated, and the compound being employed. Determination of the proper dosage for a particular situation is within the skill of the art. Generally, treatment is initiated with smaller dosages which are less than the optimum dose of the compound. Thereafter, the dosage is increased by small increments until the optimum effect under the circumstances is reached.  
30 For convenience, the total daily dosage may be divided and administered in portions during the day, if desired.

Illustrative examples of compounds made in accordance with the present invention are tested as described in EXAMPLE 22.

## EXAMPLE 22

### 5        **RAT MODEL OF FOOTPAD TACTILE ALLODYNIA FROM PRIOR INJECTION OF ACID INTO THE GASTROCNEMIUS MUSCLE**

Patients with fibromyalgia syndrome (FMS) typically demonstrate widespread, chronic musculoskeletal pain, which is often accompanied by tactile allodynia (pain in response to a relatively light tactile stimulus that is normally not painful). A rat model of persistent mechanical allodynia has been developed that  
10        is consistent with the muscle tenderness found in these patients. Multiple injections of acidified saline into the gastrocnemius muscle in rats produce a long-lasting allodynia (conveniently measured at the footpad) that is thought to be centrally mediated (Sluka K, Kalra A, Moore S. Unilateral intramuscular injections of acidic saline produce a bilateral, long-lasting hyperalgesia. Muscle  
15        Nerve 2001;24:37-46; Sluka K, Rohlwing J, Bussey R, et al. Chronic muscle pain induced by repeated acid injection is reversed by spinally administered mu- and delta-, but not kappa-, opioid receptor agonists. J Pharmacol Exp Ther 2002;302:1146-50). This model was utilized to evaluate a compound of the invention for its ability to inhibit allodynia.

20        Allodynia is induced as described by Sluka, et al. (Sluka K, Kalra A, Moore S. Unilateral intramuscular injections of acidic saline produce a bilateral, long-lasting hyperalgesia. Muscle Nerve 2001;24:37-46) with minor modifications. On Day 0, male Sprague-Dawley rats (~200 g body weight) in their dark cycle are placed in suspended wire-bottom cages and allowed to  
25        acclimate for 0.5 hours. The baseline paw withdrawal threshold is determined on the right hind paw by Von Frey monofilament hairs (bending forces of 2.0, 3.6, 5.5, 8.5, 15.1, and 28.8 g) using the Dixon Up-Down method (Dixon W. Efficient analysis of experimental observations. Ann Rev Pharmacol Toxicol 1980;20:441-62). Von Frey hairs are applied to the plantar surface for up to 6 seconds, and a  
30        flinching of the paw during that time frame is considered a positive response. After assessment, the right gastrocnemius muscle is shaved, swabbed with

alcohol, and injected with 0.1 mL of 0.9% NaCl solution acidified to pH 4 with HCl. The injection is repeated on Day 5. Animals are manipulated with a dynamic plantar aesthesiometer (Ugo Basile, Comerio-Varese, Italy) on Days 6, 7, and 8 to facilitate induction of the allodynia. To screen the rats for the development of allodynia, the 15.1 g Von Frey hair is applied to the ipsilateral paw on Day 11. Positive responders from that test are included in the compound evaluation study. On Day 12 (the day of peak allodynia), animals are assigned into treatment groups, and then their ipsilateral paw withdrawal thresholds are determined to establish the allodynia (reduction in paw withdrawal threshold) compared to baseline values. Rats are then orally dosed with 10 mL/kg vehicle (0.5% hydroxypropyl-methylcellulose/0.2% Tween 80) or an indicated dose of a compound of the invention. Paw withdrawal thresholds are reassessed by Von Frey hairs in blinded fashion 2 hours after dosing for the dose-response study, and 2, 5, 8, and 24 hours after dosing in the time course experiment. The inhibition of allodynia is determined for each animal by dividing the increase in paw withdrawal threshold after treatment by the difference between baseline and pretreatment paw withdrawal values. This fraction is then converted to percent inhibition by multiplying by 100.

In this manner, one or more compounds described above is evaluated for its ability to dose-dependently attenuate allodynia, and minimum effective doses of are determined). To determine the time course of inhibition, allodynia is monitored at various time points after a minimum effective dose of a compound of the invention.

In this manner, it is evaluated whether administration of one or more compounds described above reduces tactile allodynia to the footpad caused by prior injection of acidic saline. The time period for sustained efficacy is also determined. The results allow evaluation of a compound of the invention for treating the allodynia associated with fibromyalgia syndrome.
